Why knowledge graphs?

- Humans:

- Combat information overload
- Explore via intuitive structure
- Tool for supporting knowledge-driven tasks

- AIs:

- Key ingredient for many AI tasks
- Bridge from data to human semantics
- Use decades of work on graph analysis

RDF triples (cont.)

- ▶ An RDF Triple (*s,p,o*) is such that:
 - “*s*”, “*p*” are URI-s, ie, resources on the Web; “*o*” is a URI or a literal
 - “*s*”, “*p*”, and “*o*” stand for “subject”, “property”, and “object”
 - here is the complete triple:

```
(<http://...isbn...6682>, <http://.../original>, <http://...isbn...409X>)
```

- ▶ RDF is a general model for such triples (with machine readable formats like RDF/XML, Turtle, N3, RDFa, Json, ...)

Anatomy of a URI

René Witte

- A URI (*Uniform Resource Identifier*) uniquely identifies a resource (e.g., person, book, class of things) on the Web.
- A URI is not always a URL (*Uniform Resource Locator*)
 - URNs (*Uniform Resource Names*) are URIs that name resources without specifying how to retrieve them, e.g., urn:isbn:0451450523.
 - It's possible URLs are not available, e.g.,
`http://www.concordia.ca/comp474/lecture03/slides5`
is a valid URL, but nothing can be (currently?) retrieved from this address
- URIs have a generic syntax:

- Queries are also possible, following the format:

`scheme : [//authority]path[?query][#fragment]`

- Namespaces are used to shorten URIs and prevent name clashes, e.g., ex:me
- IRIs (*Internationalized Resource Identifiers*) are URIs with Unicode characters

W3C Recommendation

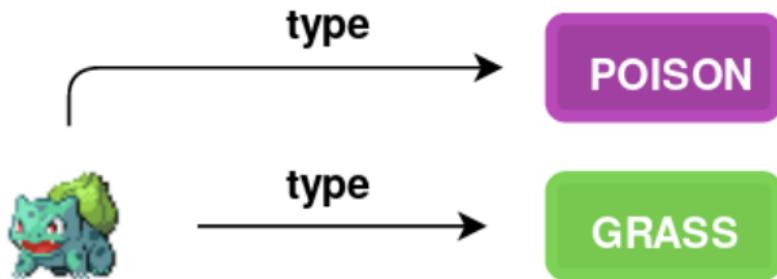

- “RDF Vocabulary Description Language 1.0: RDF Schema” (RDFS 1.0)
- Current version (2014): “RDF Schema 1.1”

Used together with RDF

- RDF provides “a way to make statements about resources” (IRIs)
- RDFS provides *semantics* about what the IRIs stand for
(Schemas aka Vocabularies aka Ontologies aka . . .)

Classes

- Resources may be divided into groups called **classes**
- The members of a class are known as **instances** of the class
- An instance can be member of **more than one class**

Defining Classes

We define that an URI in a triple is a class using ... a triple!
(sounds weird the first time you hear it, but you get used to it)

Defining Classes

To define that **C** (a resource) is an RDFS `class`, write:

C `rdf:type rdfs:Class`

with `rdfs` defined as <http://www.w3.org/2000/01/rdf-schema#>

Example

`ex:Novel rdf:type rdfs:Class`

Turtle

In Turtle, `rdf:type` can be abbreviated as `a`

Instances

To define that **I** (a resource) is an instance of **C** (a class), write:

I `rdf:type C`

(or a instead of `rdf:type` in Turtle.)

Example

`<http://...isbn/000651409X> rdf:type ex:Novel`

Note

This is just another triple, so we can read both *data* and *schema* at run-time!

Human-Readable Content

By convention, always provide:

`rdfs:label` a human-readable label

`rdfs:comment` a short (one paragraph) description

using language tags for multiple languages.

```
<http://dbpedia.org/resource/The\_Glass\_Palace>
    rdfs:label      "The Glass Palace"@en ,

Inference: let us be formal...

- ▶ The RDF Semantics document has a list of (33) entailment rules:
 - “if such and such triples are in the graph, add this and this”
 - do that recursively until the graph does not change
- ▶ The relevant rule for our example:

```
If:  
  uuu rdfs:subClassOf xxx .  
  vvv rdf:type uuu .  
Then add:  
  vvv rdf:type xxx .
```

Domain

To define a class **C** as the [domain](#) of a property **P**, write:

P [*rdfs:domain*](#) **C**

This states that resources denoted by the subjects of triples whose predicate is **P** are instances of the class **C**.

Range

To define a class **C** as the [range](#) of a property **P**, write:

P [*rdfs:range*](#) **C**

This states that the resources denoted by the objects of triples whose predicate is **P** are instances of the class **C**.

Note

- Properties are also resources (named with URIs)
- So we define properties of properties using... RDF properties!
- Again, you'll get used to it. . .

Defining a Subproperty

To define that **P1** (a property) is a **subproperty** of **P2** (a property), write:

P1 rdfs:subPropertyOf P2

With a subproperty, we can state that all resources related by one property are also related by another.

Example

Like inheritance for classes, we can have inheritance for properties:

<is father of> <subPropertyOf> <is parent of>

Some “helper” constructs

`rdfs:seeAlso` a property that links a resource to another for more information (can be in any format)

`rdfs:isDefinedBy` a property typically used to refer to a vocabulary (RDF Schema) defining the subject IRI

There are also some datastructures (bag, list etc.) – read more before using!

Goal: Knowledge Integration

Two major principles:

① Reuse of vocabularies

E.g., always use FOAF to describe names, emails, etc., instead of making up your own schema

② Make your data self-describing

Embed metadata using RDF to ensure data can be understood and processed independently.

Adhering to these principles supports interoperability and semantic understanding across different systems.

Provide useful information about new terms

For example, if we create our own proprietary term, like **SmallMediumEnterprise**, we could describe it as [HB11]:

```
1 @prefix rdf: <http://www.w3.org/1999/02/22-rdf-syntax-ns#> .  
2 @prefix rdfs: <http://www.w3.org/2000/01/rdf-schema#> .  
3 @prefix owl: <http://www.w3.org/2002/07/owl#> .  
4 @prefix co: <http://biglynx.co.uk/vocab/sme#> .  
5  
6 <http://biglynx.co.uk/vocab/sme#SmallMediumEnterprise>  
7   rdfs:type rdfs:Class ;  
8   rdfs:label "Small or Medium-sized Enterprise" ;  
9   rdfs:subClassOf <http://dbpedia.org/ontology/Company> .  
10  rdfs:subClassOf <http://umbel.org/umbel/sc/Business> ;  
11  rdfs:subClassOf <http://sw.opencyc.org/concept/Mx4rvVjQNpwpEbGdrcN5Y29ycA> ;

Reuse vocabularies whenever possible

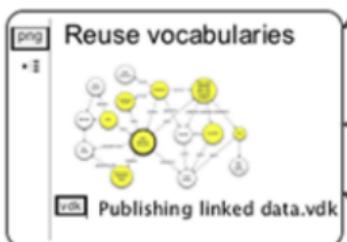

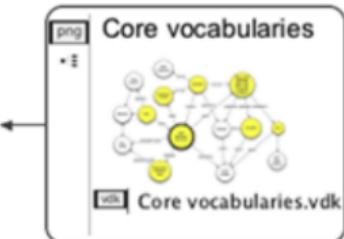

René Witte

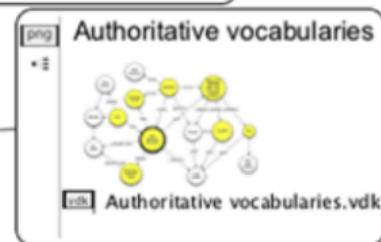

Use well-known and authoritative vocabularies to describe things whenever possible.

Describe common types of data by using terms from core vocabularies.

Use authoritative vocabularies for terms not defined by the core vocabularies.

Create your own vocabulary if necessary.

Use RDFS and OWL.

Be prepared to maintain it.

Core Vocabularies

René Witte

Use terms from these core vocabularies to describe commonly understood data.

- ? Naming things? ← Use rdfs:label, foaf:name, skos:prefLabel.
- ? Describing people? ← Use FOAF, vCard.
- ? Describing addresses? ← Use vCard.
- ? Describing projects? ← Use Description of a Project (DOAP).
- ? Describing web pages and other publications? ← Use dc:creator and dc:description.
- ? Describing an RDF vocabulary? ← Use a VoID description.
- ? Describing existing taxonomies? ← Use SKOS.

The screenshot shows a web browser window with the URL <http://id.loc.gov/authorities/sh85048050>. The page title is "Authorities & Vocabularies (Library of Congress): Fiction". The main content area is titled "Authorities & Vocabularies" and shows the term "Fiction" highlighted with a red oval. Below it, the term's URI is listed as [<http://id.loc.gov/authorities/sh85048050#concept>](http://id.loc.gov/authorities/sh85048050#concept). The term is categorized as a "Topical Term". It has several "Alternate Labels": "Fiction--Philosophy; Metafiction; Novellas (Short novels); Novels; Stories". Under "Broader Terms", there are two items: "Literature" and "Prose literature". Under "Narrower Terms", there are five items: "Adventure stories", "Allegories", "Alternative histories (Fiction)", "Bildungsromans", and "Biographical fiction". At the bottom of the page, there are links for "Details" and "Visualize".

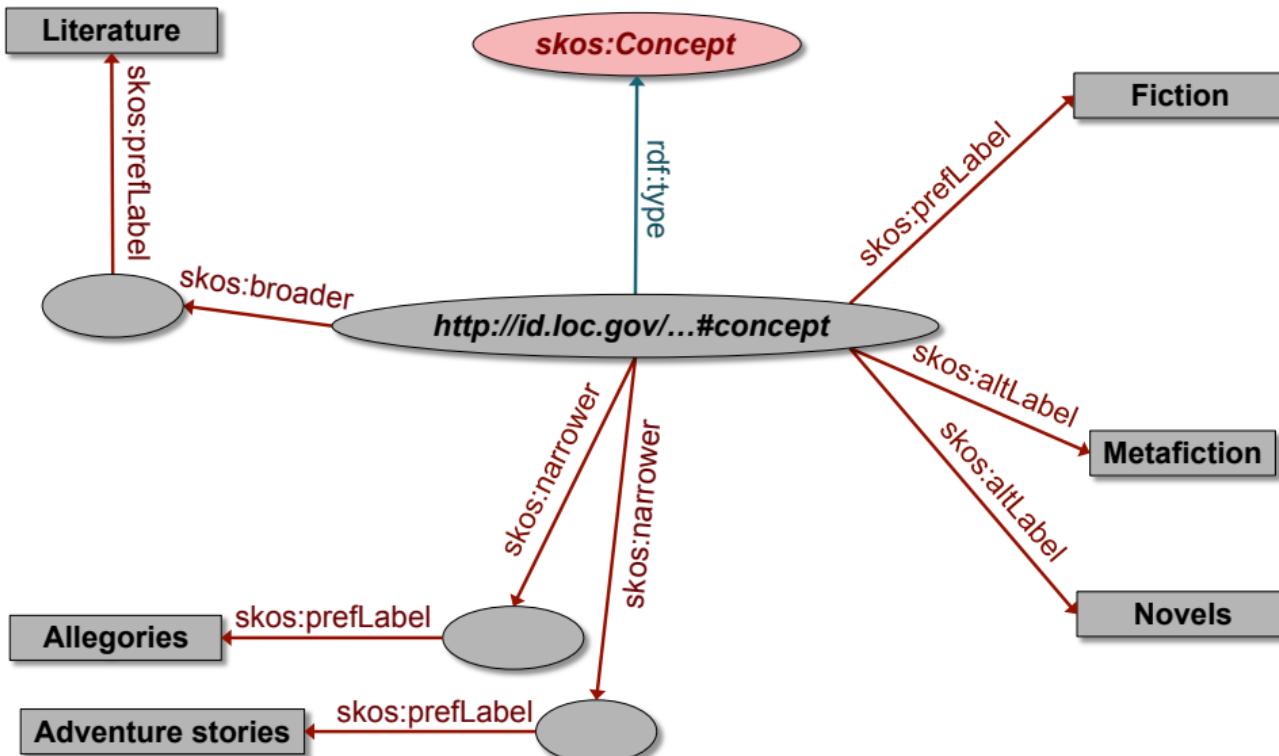

Thesauri have identical structures...

- ▶ The structure of the LOC page is fairly typical
 - label, alternate label, narrower, broader, ...
 - there is even an ISO standard for these
- ▶ SKOS provides a basic structure to create an RDF representation of these

SKOS terms overview

► Classes and Properties:

- Basic description (Concept, ConceptScheme,...)
- Labeling (prefLabel, altLabel,...)
- Documentation (definition, historyNote,...)
- Semantic relations (broader, narrower, related,...)
- Collections (Collection, OrderedCollection,...)
- Concept mappings (broadMatch, narrowMatch,...)

Importance of SKOS

- ▶ SKOS provides a simple bridge between the “print world” and the (Semantic) Web
- ▶ Thesauri, glossaries, etc, from the library community can be made available
 - LOC is a good example
- ▶ SKOS can also be used to organize, eg, tags, annotate other vocabularies, ...

Importance of SKOS

- ▶ Anybody in the World can refer to common concepts
 - they mean the same for everybody
- ▶ Applications may exploit the relationships among concepts
 - eg, SPARQL queries may be issued on the library data+LOC
